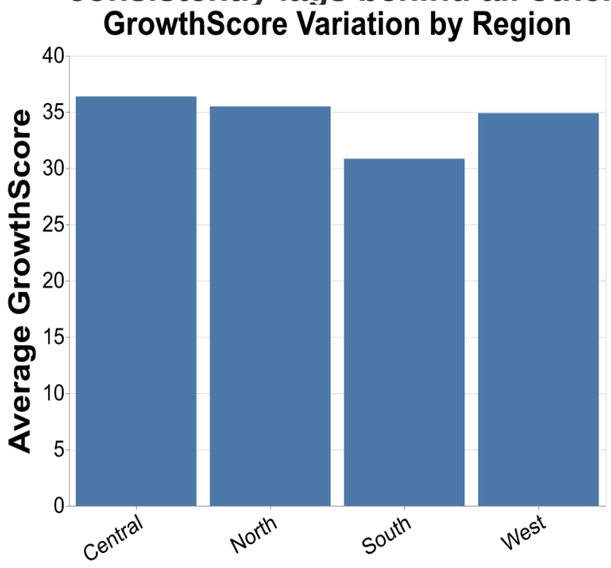
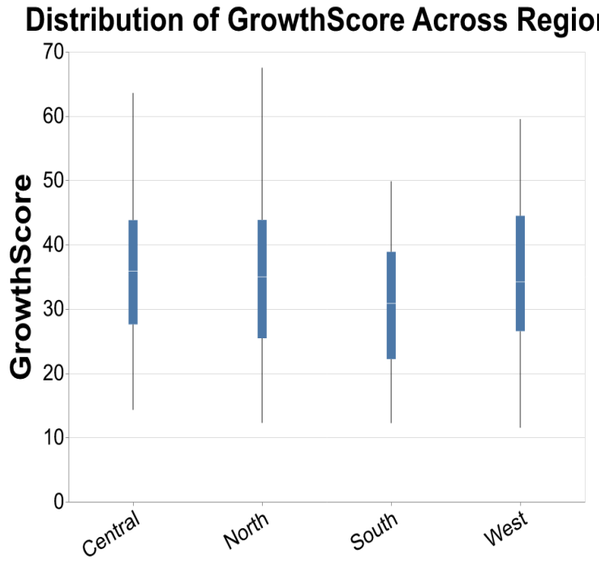
How Do Region, Species, and Color Influence GrowthScore Variations?

INTRODUCTION

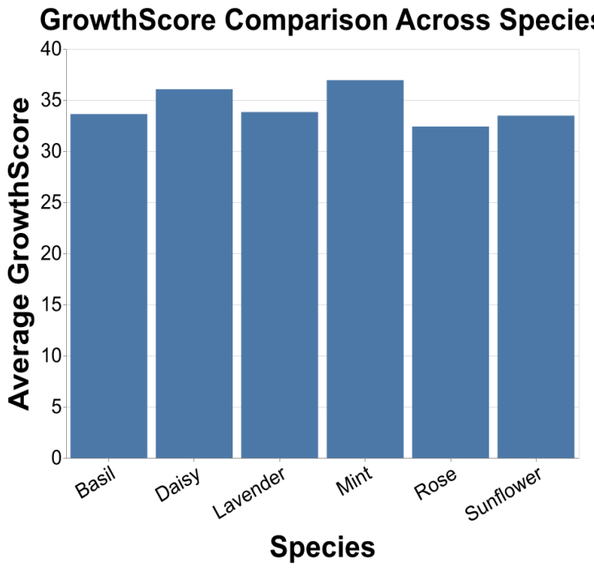
This poster analyzes GrowthScore variations by region, species, and color. Section one shows regional differences in average GrowthScore and distribution. Section two compares GrowthScore across species, highlighting Mint and Lavender rankings. Section three explores GrowthScore by region and color within Mint and Daisy species.

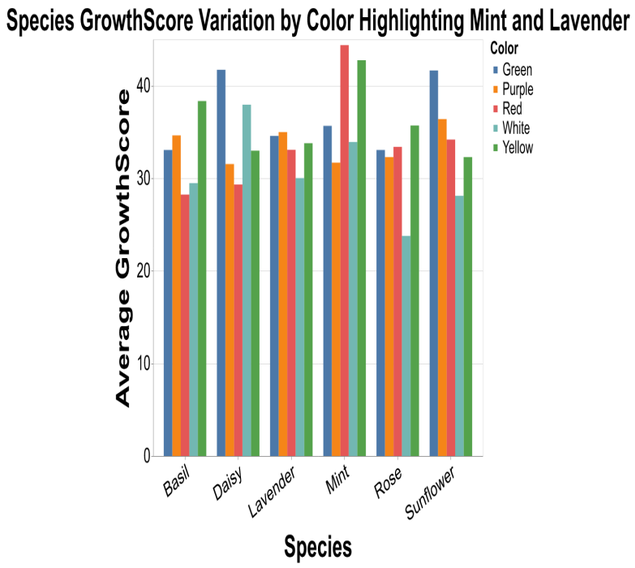
01 Central and North regions lead in GrowthScore, while South consistently lags behind all others.



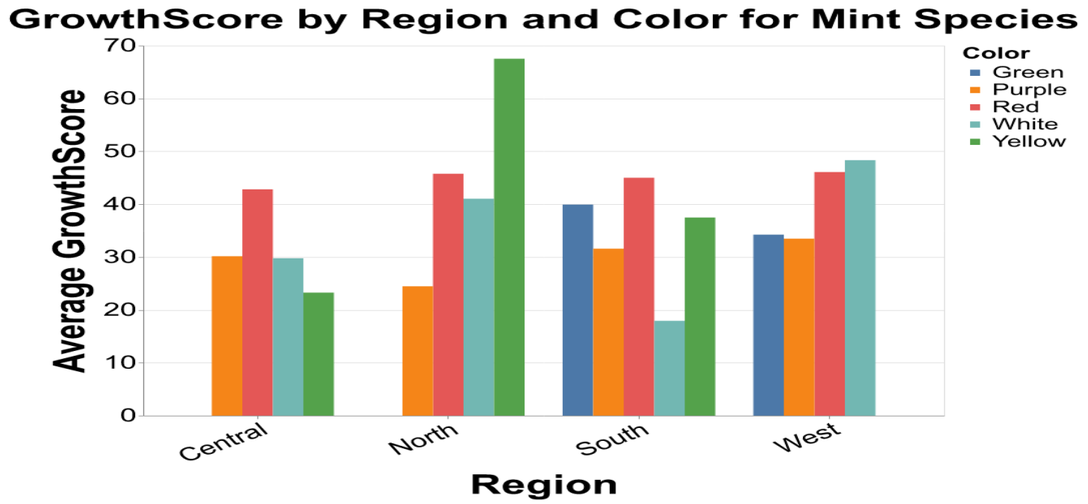


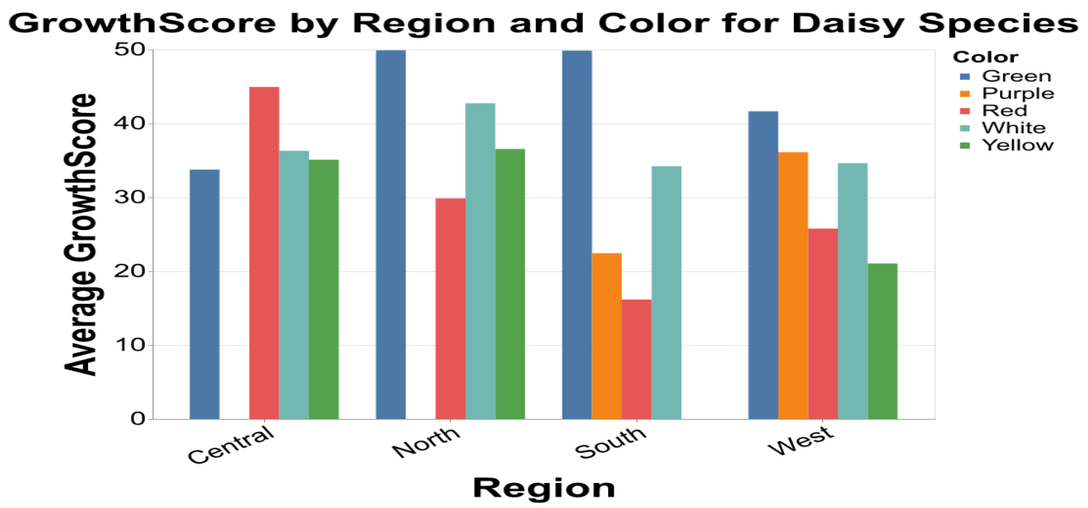
02 Mint species dominates GrowthScore and MintLavenderRank, with Basil and Daisy showing notable influence.





03 Color significantly affects GrowthScore within species, with Red, Yellow, and Green showing strongest regional growth.





CONCLUSION

Central and North regions lead GrowthScore with averages above 35, while South lags at 30.85, indicating regional disparities likely driven by environmental or economic factors.Mint and Daisy species show superior growth, with Mint and Basil dominating rank metrics, suggesting species-specific traits and color interactions strongly influence growth potential.GrowthScore varies widely by color-region pairs; Mint excels in Red, while Daisy's Green color shows consistent regional dominance, highlighting complex environmental and genetic interactions.
